Brabidopsis full-length cDNA library was constructed essentially as reported previously (Seki et al., 1998). This clone is in a modified pBluescript vector as a Sstl/Khol insert. Please visit our further details.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 T04323 400 bp mRNA linear EST 06-NOV-1997 370 Lambda-PRL2 Arabidopsis thaliana CDNA clone 37F10T7, mRNA sequence.

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

For the latest information on annotation of this clone, please see
http://www.kazusa.or.jp/kaos/cgi-bin/agd_graph.cgi?c=MFCi6
Genes with similarity to proteins in the databases are described in
'product' or 'note' qualifiers. Genes that have no significant
protein similarity are described as 'unknown protein'.
The software programs used to predict genes include: Grail
(Informatics Group, Oak Ridge National Laboratory,
http://compbio.ornl.gov/Grail-1.3/),
GENSCAN (Chris Burge, MIT, http://CCR-081.mit.edu/GENSCAN.html),
NetGenes (S.M. Hebsgaard, et al., CBS, Technical University of
Denmark, http://www.cbs.dtu.dk/services/NetGene2/) and
SplicePredictor (Volker Brendel, Stanford University,
Genes encoding tRNAs are predicted by tRNAscan-SE

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Juctes General DNA prepared from rosette leaves. DNA was amplified and directly sequenced from both directions and sassembled into a consensus sequence. Note: Sequencing gratted in the context of the GABI Arabidopsis Verbund: Genetic Diversity, 'Establishment of high-efficiency SNP-based mapping tools and development of methods for genome-wide mutation detection' PIS: Thomas Altmann, Thomas Mitchell-Odds, Bernd Weisshaar!

Alyssum antifungal polypeptide and corresponding DNA - used in the production of transgenic plants resistant to phytopathogenic fungi

This sequence encodes the mature protein of an antifungal polypeptide (AlyARP) isolated from plants of the genus Alyssum. The sequence was PCR amplified using primers AAT94583-T94584, and the resultant 264 bp fragment was cloned as a BamHI fragment into the expression vector pMOM23317 to generate plasmid pMOM2552. The AlyARP sequence in this plasmid is placed under control of an B35S promoter and the maize HSP70 intron I sequence. The protein can be used to control phytopathogenic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention comprises the amino acid and coding sequences of antimicrobial (defensin) proteins from Brassica. The DNA and protein sequences of the invention are useful for producing transformed plants with composite disease resistance, especially resistant to diseases caused by pathogenic bacteria, such as: rice white leaf blight, brownstripe disease, glume blight, and seedling damping-off disease. As well as diseases caused by filamentous fungi, such as: rice blight, sheath blight disease, and leaf blight. The present DNA sequence encodes a Brassica defensin protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      151 AAGAATCAGTGGATTAACCTTGAGAAAGCACGACATGGATCTTGCAACTATGTCTTCCCA

The sequence represents a composite of the sequences isolated by 5' and 3' RACE (Rapic Amplification of CDNA Ends) methods (see AAT94577 and AAT94580). The AlyArP polypeptide can be used to control phytopathogenic fungi, whilst the coding DNA can be used to produce transgenic plants that express the control and an express the coding of the coding that that express the coding that the coding the code of the coding that the coding that the coding that the coding that the coding the code of the coding that the coding that the coding that the coding the code of the coding that the coding that the coding that the coding that the coding the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of the code of th

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    61
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention comprises the amino acid and coding sequences of antimicrobial (defensin) proteins from Brassica. The DNA and protein sequences of the invention are useful for producing transformed plants with composite disease resistance, especially resistant to diseases caused by pathogenic bacteria, such as: rice white leaf blight, brownstripe disease, glume blight, and seedling damping-off disease. As well as diseases caused by filamentous fungi, such as: rice blight, sheath blight disease, and leaf blight. The present DNA sequence encodes a Brassica defensin protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0;

```
The present invention relates to a method (M1) for identifying genes involved in plant resistance or response to pathogenic infection. M1 comprises identifying a gene whose expression is significantly altered in the incompatible interaction of plant gene expression relative to expression of the gene in an uninfected plant, in a mutant plant that does not express a gene associated with response to pathogenic infection, or in a corresponding incompatible or compatible interaction. (M1) is useful for conferring resistance to resistance or tolerance to a plant to bacterial, fungal or viral infection. The present sequence was used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying at least one gene involved in plant resistance or response pathogenic infection for conferring resistance or tolerance to a plant bacterial, fungal or viral infection by determining or detecting plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   151 AAGAATCAGTGCATTAACCTTGAGAAAGCACGACATGGATCTTGCAACTATGTCTTCCCA

                                                                                                                                                                                                                                                                                                                                            Protecting plants against pathogens by inducing defensin genes - by stimulating ethylene or jasmonate pathways, also new promoter of defensin gene from Arabidopsis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               62 AGGAACCAATGCAGAAACCTTGAAAGAGCAGAACACGGATCTTGCAACTATGTCTTCCCA 121
                                                                                                                                                                                                                                                                                                                                                                                               This sequence encodes the Arabidopsis PDF1.1 gene which is used in a novel method for the protection of plants against pathogens which involves inducing expression of a plant defensin gene by stimulating the jasmonate and/or ethylene pathways. The method is used to induce protection against necrotrophic pathogens, specifically fungi and does not require cytotoxic or potentially harmful chemicals

Also described is a method for the creation of the above disease-resistant plant in throducing a wasabi gamma-thionin gene to a plant. The present sequence encodes a Butrema wasabi (Wasabia japonica) gamma-thionin protein from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   150

cell has been exposed, comprising: (a) contacting nucleic acid arrepresentative of expressed polynucleotides in the plant cell with an array or probes representative of the plant cell genome; and (b) detecting a profile of expressed polynucleotides in the plant cell characteristic of a stress response. The method is useful in the production of transgenic plants. Cells and seeds and in producing plants with increased tolerance to abiotic stress. The present sequence is that of an Arabidopsis thaliana stress regulated gene (ABZ12196-ABZ17574) used in methods of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to berwent by the European Patent Office
                                                                                                                                                                                                                                                                                                          Identifying a stress condition to which a plant cell has been exposed and producing plants with increased tolerance to these abiotic stresses.
                                                                                                                                                                                                                                                                                                                                                                                          invention relates to identifying a stress condition to which a plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Posttranscriptional gene silencing; PTGS; plant; transformation; gene;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              2 AGGITGIGCGAGAGACCAAGIGGGACATGGTCAGGAGTTTGTGGGAACAACAATGCATGC

The invention relates to a novel isolated polynucleic acid segment modulated within a cell by posttranscriptional gene silencing (PTGS). The invention specifically relates to a method to identify an expression product that is modulated by PTGS. The polynucleotide is useful for modulating the gene expression within a cell by PTGS, by introducing the polynucleic acid into a cell and expressing the nucleic acid segment in the cell to form a product. The polynucleic acid segment is also useful for augmenting a cell and expressing the nucleic acid segment in contacting a plant cell with the segment to produce a transformed plant cell, and growing the transformed plant to produce a transformed plant segments of A. thaliana cDNA modulated by PTGS
                                                                                                                                                                                                                                                               Novel polynucleic acid segment useful for modulating gene expression within a cell by posttranscriptional gene silencing, and for augmenting plant cell genome.

This cDNA represents the sequence of Rs-AFP1 from Raphanus sativus. PCR primer AAQ38640 was used together with AAQ38641 to generate a probe for screening a Raphanus sativus seed cDNA library. This primer corresponds to amino acids 2 to 7 of Rs-AFP1 and has a sense orientation. The 144bp product, which was further reamplified with the same primers and digoxiganin-11-dUTP instead of dTTP to give a digoxiganin-11-dUTP instead of dTTP to give a digoxiganin-11-dUTP instead of dTTP to give a digoxiganin labeled PCR product. This was used to screen a lambda ZAPII CDNA library by in situ product. This was used to screen a lambda EAPII cDNA library by in situ additional screening rounds with the same probe. Inserts by in situ vivo into the pBluescript phagemid form with the aid of helper phage R408.Inserts from 22 positive clones were excised by BcoRI digestion and their size compared by agarose gel electrophoresis. Four clones had insert sizes of approx. 400bp the others between 250-300bp. The inserts compared their squeen defined and found to differ only in the length of their 5' and 3' UTR's. The longest sequence is given here. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   62 AGGAACCAATGCAGAAACCTTGAAAGAGCAGAACACGGATCTTGCAACTATGTCTTCCCA 121

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence encodes the Arabidopsis PDF1.2 gene which is used in a novel method for the protection of plants against pathogens which involves inducing expression of a plant defensin gene by stimulating the jasmonate and/or ethylene pathways. The method is used to induce protection against necrotrophic pathogens, specifically fungi and does not require cytotoxic or potentially harmful chemicals

                                                                                                                                                                                                                                                                                                                                                                                              Plant-derived antimicrobial proteins are expressed in endosymbiotic Clavibacter xyli subsp. cynodontis (Cxc). Plants or seeds treated with recombinant Cxc are protected against fungal disease. A suitable antimicrobial protein is Rs-AFP1 from R. sativus. The full-length cDNA sequence of Rs-AFP1 is given in AAQ70128. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                             Antimicrobial protein producing endo-symbiotic microorganisms - is produced by combining nucleic acids encoding the protein with an endophyte, useful for protecting plant hosts from esp. fungal disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             62 AGGAACCAATGCAGAAACCTTGAAAGAGCAGAACACGGATCTTGCAACTATGTCTTCCCA 121
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This cDNA sequence encodes an Rhapanus sativus (radish) antifungal protein (Rs-AFP1). Analogues of the homologous protein, Rs-AFP2 (AAM19281), have also been produced (see AAM1928292, AAM19284-98, AAM19301-04, AAM19310-34 and AAM17165-834). Plants containing DNA sequences encoding these proteins have improved resistance to fungi. Compositions containing the peptides can be used to control fungi or bacteria in pharmaceutical (e.g. treatment of Candida infections) or preservative purposes (as food additives). In agriculture, the peptide may be used to improve disease resistance or disease tolerance of crops, either pre or post harvest. When applied to plants they may also have curative as well as protective actions. The peptides may also be used to protect plants by introducing them, or a microorganism capable of protect plants by introducing them, or a microorganism capable of the preservation of the soil. Sequence 9, Application US/09829381D

| Sequence 9, Application US/09829381D
| Patent No. 6653280
| GENERAL INFORMATION:
| APPLICANT: Liang, Jihong
| APPLICANT: Rosenberger, Cindy A.
| APPLICANT: Rosenberger, Cindy A.
| APPLICANT: Rosenberger, Cindy A.
| TITLE OF INVENTION: Antifungal Polypeptide ALYAFP from Alyssum and Methods for Control
| TITLE OF INVENTION: Plant Pathogenic Fungi
| FILE REFERENCE: 38 -21 (10700) C
| CURRENT APPLICATION NUMBER: US/09/829,381D
| PRIOR PILIATION NUMBER: 09/103,489
| PRIOR FILIATION NUMBER: 09/103,489
| PRIOR FILING DATE: 1998-06-24
| NUMBER OF SEQ ID NOS: 20
| SOFTWARE: PatentIn version 3.1
| LENGTH: 500
